

# Private Call

Anytone 868 – 878 – 578

Do a Manual Dial -

Go to Menu – Talk Group - Manual Dial - enter the users 7 dig ID number *1234567*.

Do not push any other buttons – Just the PTT and talk.

\* Depending on the hang time set in your CPS you will stay connected as long as you both replay to each other within that time.

*Photo is for demonstration only.*

I would recommend taking the Hold time in the CPS for **Person Call Hold Time** and **Dial Private Hold** to its maximum.

If you do exceeded your hold time you will have to follow the steps above again.

or

You can add the users 7 dig ID to your Talk group list as **PRIAVTE CALL**.

Then make up a channel, add to a Zone as you would for normal channels.

Turn the radio to that channel and talk to each other.

or

You can also do Private Call by Holding down the 0 key.

Enter the users 7 dig ID number *1234567*.

Do not push any other buttons – Just the PTT and talk.

\* **Dial Private Hold** will also need to be set to HIGHT if using this method.

If you do exceeded your hold time you will have to follow the steps above again.

## **How to clear a private call.**

As you have set the hang times high, the fastest way to clear the private call is just turn the channel knob up or down one channel and back.

# Information

Private call can be done on either time slots and the other party will receive you.  
If using a Repeater use the seconder slot, as while your in private call that slot can not be used by others (UK use Slot 1 as Slot 2 is Primary).

**Private call via a repeater does not mean that others can not listen in.  
Newer radios can listen in, so be aware of what you say over the air.**

**This can also happen over a Hotspot if someone is close enough to your Hotspot and has your frequency and Colour Code.  
Your Hotspot information is public via Brandmeister Dashboards.**

All Amateur Radios rules apply when using Private Call.
